Block 3: Analysing two variables (and sometimes three)

3.1.4.5 Income differences for derived test variables [Draft only: 19 August 2013]

Research questions:

Is there a difference between the earnings (from paid work) of men and women?

See sessions: 2.3.1.6.2: Specimen answer for tasks 3 and 4

3.1.4.1 Income differences work-through

What other variables might account for differences in earnings?

See sessions: 3.1.4.2 Income differences - Build working file

3.1.4.3 Income differences for test variables

3.1.4.4 Income differences - Choose test variables and cutting points

What effect do they have by themselves?

What happens to any differences in earnings between men and women when controlling for these other variables?

Exemplar: British Social Attitudes 1989

Files: 3.1.4.4.sav

[Created in session 3.1.4.4 and saved to e:weebly downloads\bsa89\]

In session <u>3.1.4.4 Income differences - Choose test variables and cutting points</u> we selected possible test variables from the full data set, then created derived variables with fewer categories to make the data easier to work with.

Cutting points were chosen to keep category counts large enough to act as a base for percentages, but also bearing in mind the need for the resulting categories to make sociological sense.

We finished up with the following test variables:

Mode of work

| | | Frequency | Percent | Valid Percent | Cumulative Percent |
|---------|----------|-----------|---------|------------------|-----------------------|
| | Parttime | 317 | 10.5 | 18.8 | 18.8 |
| Valid | Fulltime | 1365 | 45.1 | 81.2 | 100.0 |
| · and | Total | 1682 | 55.6 | 100.0 | |
| Missing | System | 1343 | 44.4 | | |
| Total | | 3025 | 100.0 | | |

Social class of work

| | | Frequency | Percent | Valid Percent | Cumulative Percent |
|---------|------------|-----------|---------|------------------|-----------------------|
| | Non-manual | 1487 | 49.2 | 52.2 | 52.2 |
| Valid | Manual | 1359 | 44.9 | 47.8 | 100.0 |
| | Total | 2846 | 94.1 | 100.0 | |
| Missing | System | 179 | 5.9 | | |
| Total | | 3025 | 100.0 | | |

Highest qualification level

| | | | | Percent | Percent |
| | 18 – 29 | 668 | 22.1 | 22.1 | 22.1 |
| | 30 – 49 | 1124 | 37.2 | 37.2 | 59.2 |
| Valid | 50 or over | 538 | 17.8 | 17.8 | 77.0 |
| · ana | Pensioner | 695 | 23.0 | 23.0 | 100.0 |
| | Total | 3025 | 100.0 | 100.0 | |

What effect on earnings from paid work do these variables have by themselves?

Homework exercise:

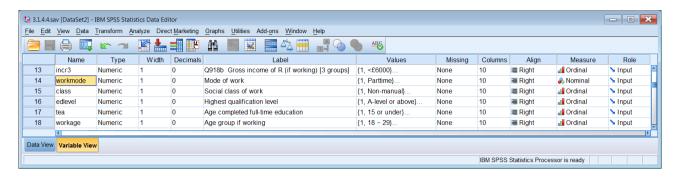

Taking grouped personal income incr3 as the **dependent** variable and **workmode**, **class**, **edlevel**, **tea** and **workage** as the **independent** variables, produce joint frequency distributions (contingency tables) with appropriate percentages to compare the earnings of different groups.

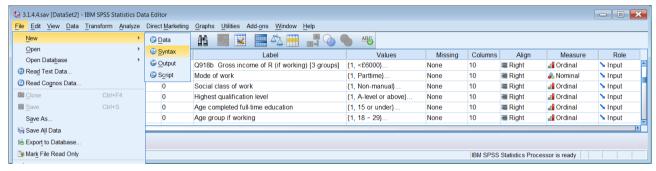

To get tables which are in fact easier to interpret, put the independent variables down the side of the tables (the rows) and the dependent variable across the top (the columns) using my preferred sociological rather than the statistical convention.

Which percentages do you need, and why?

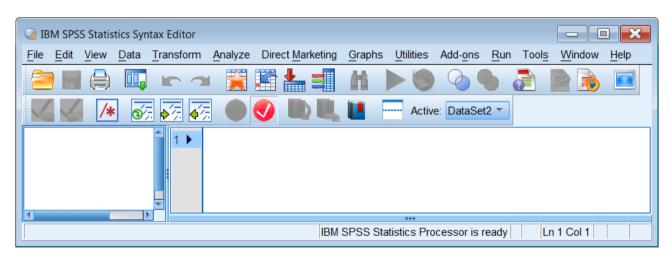

There's a specimen answer on the next page, but try to do this without peeping!

Open file 3.1.4.4.sav

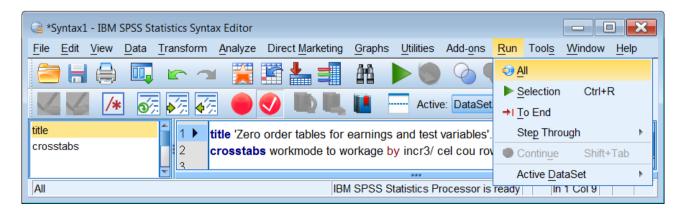

File > New > Syntax to open a new Syntax Editor:

title 'Zero order tables for earnings and test variables'. crosstabs workmode to workage by incr3/ cel cou row.

Place the cursor on the title command and press Run > All.

Case Processing Summary

| | Cases | | | | | | |
|---|-------|---------|---------|---------|------|---------|--|
| | Vali | id | Missing | | Т | otal | |
| | N | Percent | N | Percent | N | Percent | |
| Mode of work * Q918b Gross income of R (if working) [3 groups] | 1560 | 51.6% | 1465 | 48.4% | 3025 | 100.0% | |
| Social class of work * Q918b Gross income of R (if working) [3 groups] | 1538 | 50.8% | 1487 | 49.2% | 3025 | 100.0% | |
| Highest qualification level * Q918b Gross income of R (if working) [3 groups] | 1554 | 51.4% | 1471 | 48.6% | 3025 | 100.0% | |
| Age completed full-time education * Q918b Gross income of R (if working) [3 groups] | 1556 | 51.4% | 1469 | 48.6% | 3025 | 100.0% | |
| Age group if working * Q918b Gross income of R (if working) [3 groups] | 1560 | 51.6% | 1465 | 48.4% | 3025 | 100.0% | |

Mode of work * Q918b Gross income of R (if working) [3 groups] Crosstabulation

| | | Q918b Gross | Q918b Gross income of R (if working) [3 groups] | | | |
|--------------|------------|--------------------------------|---|--------------|--------------|----------------|
| | | | <£6000 | <£12000 | £12000 + | |
| | Dorttimo | Count | 257 | 31 | 9 | 297 |
| Mada etadı | Parttime | % within Mode of work | 86.5% | 10.4% | 3.0% | 100.0% |
| Mode of work | Culltima o | Count | 212 | 562 | 489 | 1263 |
| Total | Fulltime | % within Mode of work Count | 16.8% 469 | 44.5% 593 | 38.7% 498 | 100.0% 1560 |
| Total | | % within Mode of work | 30.1% | 38.0% | 31.9% | 100.0% |

The tables produced are quite cluttered (see example above) and not easy to interpret, so it's easier to just ask for row percent, but then we lose the row totals:

crosstabs workmode to workage by incr3 / cel row.

Mode of work * Q918b Gross income of R (if working) [3 groups] Crosstabulation

% within Mode of work

| | | Q918b Gross | s income of R (if working | income of R (if working) [3 groups] | | |
|--------------|----------|-------------|---------------------------|-------------------------------------|--------|--|
| | | <£6000 | <£12000 | <£12000+ | | |
| Mode of work | Parttime | 86.5% | 10.4% | 3.0% | 100.0% | |
| Mode of work | Fulltime | 16.8% | 44.5% | 38.7% | 100.0% | |
| Total | | 30.1% | 38.0% | 31.9% | 100.0% | |

We already know that the category counts within the derived variables are large enough to serve as a base n for % and the 100% in the above table tells us nothing, so I've modified it below by substituting n for 100%, getting rid of the % signs in the table body, moving the row total to the top of the table and calculating epsilons (percentage point differences) for the dichotomies.

The effect of part-time working is so marked that we should think about leaving the part-time workers out and restricting our analysis to those working full-time.

Mode of work * Q918b Gross income of R (if working) [3 groups] Crosstabulation

% within Mode of work

| % WITHIT Mode of Work | | | | | | | | |
|-------------------------------|----------|----------------------|---|----------------------|--------|--|--|--|
| | | Q918b Gros | Q918b Gross income of R (if working) [3 groups] | | | | | |
| | | <£6000 % | <£12000 % | £12000+ % | n=100% | | | |
| Total | Total | | 38.0 | 31.9 | 1560 | | | |
| Mode of work | Parttime | 86.5 | 10.4 | 3.0 | 297 | | | |
| Mode of work Fulltime Epsilon | | 16.8 -69.7 | 44.5 +34.1 | 38.7 +35.7 | 1263 | | | |

There is a clear gradient in favour of non-manual work:

Social class of work * Q918b Gross income of R (if working) [3 groups] Crosstabulation

% within Social class of work

| 76 WILLIII SOCIAI CIASS OF W | OIK | | | | | |
|------------------------------|------------|-------------|---|--------------|--------|--|
| | | Q918b Gros | Q918b Gross income of R (if working) [3 groups] | | | |
| | | <£6000 % | <£12000 % | £12000+ % | n=100% | |
| 7 | Total | | 37.8 | 31.9 | 1538 | |
| Social class of work | Non-manual | 25.5 | 33.5 | 41.0 | 859 | |
| Social class of work | Manual | 36.4 | 43.3 | 20.3 | 679 | |
| | Epsilon | -10.9 | -9.8 | +20.7 | | |

Educational qualifications [edlevel] and terminal education age [tea]show clear gradients in both lower and upper earnings categories, but these two variables will be correlated, so their effect will be to some extent confounded: perhaps we should just use one of them?

Highest qualification level * Q918b Gross income of R (if working) [3 groups] Crosstabulation

% within Highest qualification level

| | | Q918b Gros | Q918b Gross income of R (if working) [3 groups] | | | |
|-----------------------------|------------------|-------------|---|--------------|--------|--|
| | | <£6000 % | <£12000 % | £12000+ % | n=100% | |
| | Total | | 38.0 | 32.0 | 1554 | |
| | A-level or above | 12.2 | 33.7 | 54.1 | 615 | |
| Highest qualification level | O-level or CSE | 35.0 | 45.1 | 19.9 | 472 | |
| | None | 48.2 | 36.6 | 15.2 | 467 | |

Age completed full-time education * Q918b Gross income of R (if working) [3 groups] Crosstabulation

% within Age completed full-time education

| | Q918b Gros | Q918b Gross income of R (if working) [3 groups] | | | |
|-----------------------------------|-------------|---|--------------|--------------|--------|
| | | <£6000 % | <£12000 % | £12000+ % | n=100% |
| Total | | 30.1 | 38.0 | 31.9 | 1556 |
| | 15 or under | 40.3 | 38.9 | 20.8 | 573 |
| Age completed full-time education | 16 or 17 | 28.5 | 40.7 | 30.8 | 600 |
| | 18 or over | 17.2 | 32.6 | 50.1 | 383 |

The education variables are not dichotomies, but we can instead calculate the percentage difference between the highest and lowest educational categories:

| | Q918b Gross income of R (if working) [3 groups] | | |
|--------------------------------|---|---------|---------|
| | <£6000 | <£12000 | £12000+ |
| | % | % | % |
| edlevel (A level - None) | -36.0 | -2.9 | +38.9 |
| tea (18 or over - 15 or under) | -23.1 | -6.3 | +29.3 |

The effects of age are less clear. There is little difference between age groups at the lower end of the earnings scale, but a marked leap of 19.8 percentage points after age 30.

Age group if working * Q918b Gross income of R (if working) [3 groups] Crosstabulation

% within Age group if working

| - | | Q918b Gross income of R (if working) [3 groups] | | | |
|----------------------|------------|---|----------------|------|--------|
| | | <£6000 % | C12000 C12000+ | | n=100% |
| Т | otal | 30.1 | 38.0 | 31.9 | 1560 |
| Age group if working | 18 – 29 | 28.8 | 51.4 | 19.8 | 420 |
| | 30 – 49 | 29.9 | 30.4 | 39.6 | 815 |
| | 50 or over | 28.7 | 40.7 | 30.7 | 300 |
| | Pensioner | 72.0 | 28.0 | | 25 |
| | | | | | |

We could try a different grouping of 18 -39 and 40+, but this is inconclusive and again there may also be some interaction with other variables.

workage2 * Q918b Gross income of R (if working) [3 groups] Crosstabulation

% within workage2

| | | Q918b Gross income of R (if working) [3 groups] | | | |
|----------|-----------------------|---|--------------|---------------|------------|
| | | <£6000 % | <£12000 % | £12000 + % | n = 100% |
| | Total | 30.1 | 38.0 | 31.9 | 1560 |
| workage2 | 18 – 39 40 or over | 28.3 30.6 | 41.0 35.0 | 30.7 34.4 | 809 726 |
| | Epsilon | +2.3 | -6.0 | +3.7 | |

Working with contingency tables for three or more variables can quickly lead to masses of indigestible information, especially when we start investigating combinations of independent variables. We also need to be aware of possible interactions between variables. For instance many older respondents will have completed their full time education at a much younger age. Access to better paid non-manual work will be dependent on educational qualifications which older respondents have not had the opportunity to acquire.

We also need to think about simplifying vast amounts of information by refining our analysis. One way of doing this is to restrict the sample to more homogeneous categories such as people working full-time rather than part-time, or who are employees rather than self-employed. Given that political arguments about gender discrimination in earnings are normally concerned only with employees, this makes sense. At the very least we also need to analyse part-time and full-time workers separately.

Another research trick is to choose a single category of the dependent variable, treat that as a criterion value then simply tabulate that by categories of the independent variable. It doesn't matter whether this is the low-earning or high-earning category, but we'll take the latter and summarise the results of this session by tabulating the percentage earning £12,000 or more per annum.

For the whole sample this was 31.9%, but this figure is only a weighted average of all the possible sub-samples earning £12,000 pa or more.

People earning £12,000+ from paid work

| | Category | % | n = 100% | |
|------------------------|--|----------------------|-------------------|-----------------------|
| Variable | All | 31.9 | 1560 | Zero order epsilon |
| Sex | Men Women | 48.7 10.5 | 874 686 | +38.2 |
| Work mode | Parttime Fulltime | 3.0 38.7 | 297 1263 | +35.7 |
| Social class | Non-manual Manual | 41.0 20.3 | 859 679 | +20.7 |
| Educational quals | A-level or above O-level or CSE None | 54.1 19.9 15.2 | 615 472 467 | +38.9 |
| Terminal education age | 15 or under 16 or 17 18 or over | 20.8 30.8 50.1 | 573 600 383 | +29.3 |
| Age group | 18 – 29 30 – 49 50 or over | 19.8 39.6 30.7 | 420 815 300 | +19.8 |

In the next session we'll be producing three-way contingency tables to see what happens to income differences between men and women when controlling for the newly derived test variables.

End of session: 3.1.4.5 Income differences for derived test variables

Back to: 3.1.4.4 Income differences - Choose test variables and cutting points [b]

Forward to: <u>3.2 Three variables</u>

[Back to Block 3: Analysing two variables]
